

68000 Storage Layout (Software Convention)

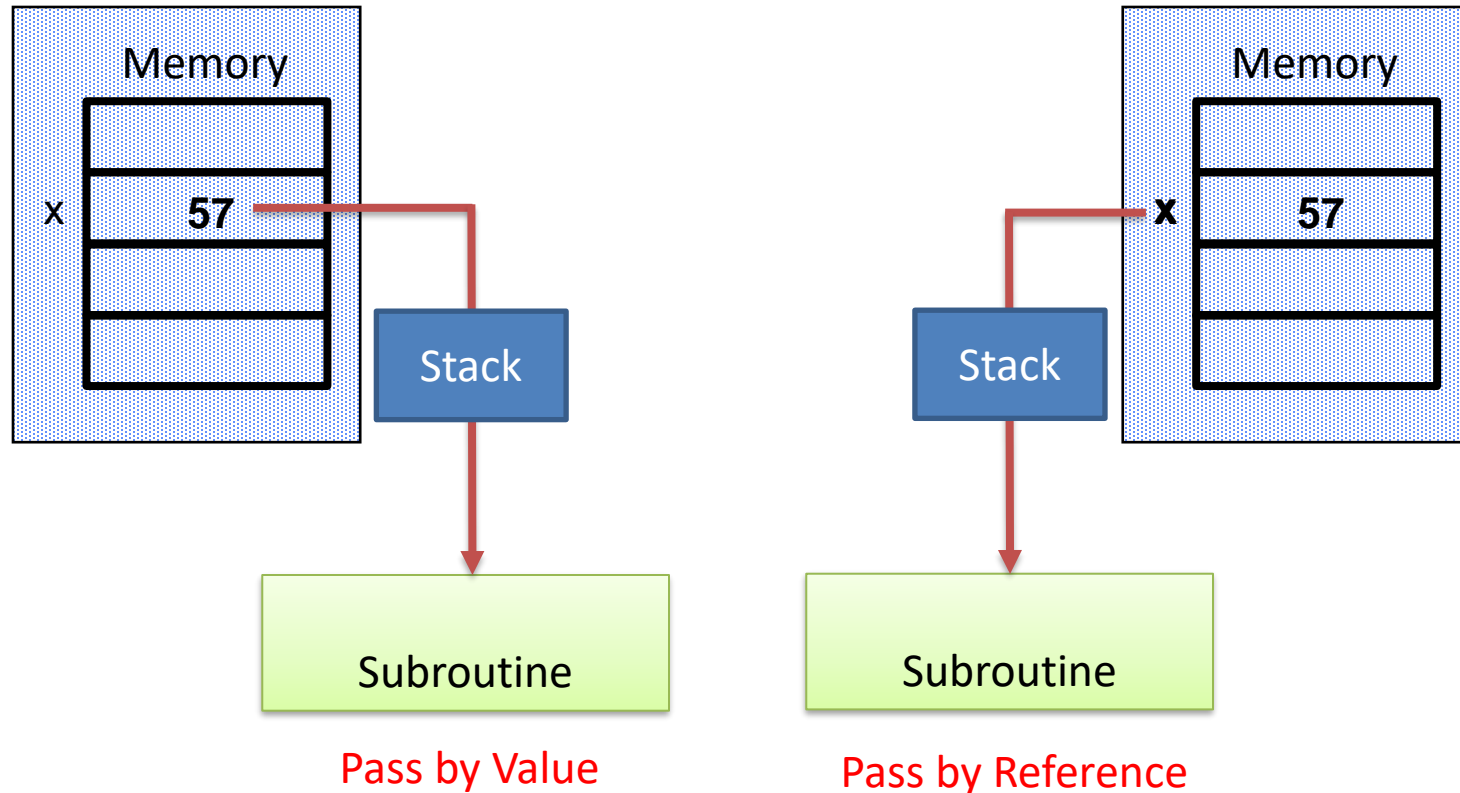

Implementing Functions

- Functions are required for structured programming
 - Aka: procedures, methods, subroutines...
- Implementing functions in assembly requires several things to be done
 - Parameters must be passed in and return values passed out
 - Registers
 - Stack
 - Memory must be set aside for local variables
 - Heap
 - Stack
 - Execution must continue after the call
 - Stack

Passing Parameters on the Stack

- Both the “caller” and the “callee” must know the number, order and type of parameters being passed
 - In C we use a function prototype
 - `void Foo (int a, char b, int *c);`
 - In assembler, you must take care of this yourself
 - C passes parameters right to left
- After returning from a subroutine
 - calling code must remove any parameters from the stack
- Parameters may be passed by value or passed by reference
 - Pass-by-value:
 - copy of parameter is passed
 - Pass-by-reference:
 - address of parameter is passed

Pass by Value/Reference

C Function – Pass by Value

- Consider the following code

```
void foo() {  
    short int a=4, b=5, c=2;  
    register int product;  
  
    product = mul3(a,b,c);  
}  
  
int mul3(short int x, short int y,  
        short int z) {  
  
    return (x*y*z);  
}
```

Assembler Code – Pass by Value

*** foo() calling code**

```
move.w    c, -(sp)      ;push 1st parameter
move.w    b, -(sp)      ;push 2nd parameter
move.w    a, -(sp)      ;push 3rd parameter
jsr       mul3          ;call subroutine
lea       6(sp), sp     ;remove parameters
```

*** mul3() multiplies 3 short ints and returns result in d0**

```
mul3      move.w    4(sp), d0      ;d0 = a
          muls      6(sp), d0      ;d0 = a * b
          muls      8(sp), d0      ;d0 = a * b * c
          rts                          ;return
```

```
          org       $A000          ;variables
a         dc.w      4
b         dc.w      5
c         dc.w      2
```

Transparency

- A “transparent” subroutine does not change any registers
 - Also known as “preserving registers across a call”
 - Achieving transparency:
 - Register values are “saved” when first entering the subroutine
 - Restored prior to leaving the subroutine
- Where do we store the registers?
 - On the stack

MOVEM Instruction

MOVEM Move Multiple Registers

Syntax: `MOVEM reg.list,<ea>`
 `MOVEM <ea>,reg.list`

Operation: `registers -> destination`
 `source -> registers`

- Pre-decrement address mode (Push)

- Post-Increment address mode (Pop)

Example

- Consider the following code

```
SUB    MOVEM.L    D1-D3/A0, -(SP)
      .
      .
      .
      MOVEM.L    (SP)+, D1-D3/A0
      RTS
```

Example

- Consider the following code

```
SUB    MOVEM.L    D1-D3/A0, -(SP)
      .
      .
      .
      MOVEM.L    (SP)+, D1-D3/A0
      RTS
```

Example

- Consider the following code

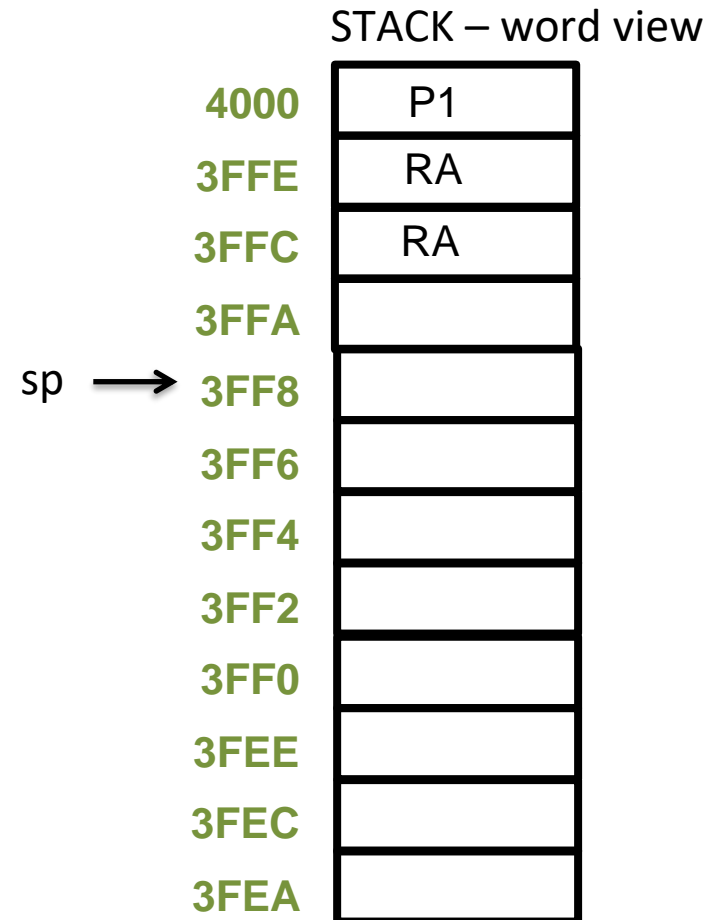

```
SUB    MOVEM.L    D1-D3/A0, -(SP)
      .
      .
      .
      MOVEM.L    (SP)+, D1-D3/A0
      RTS
```

Example

- Consider the following code

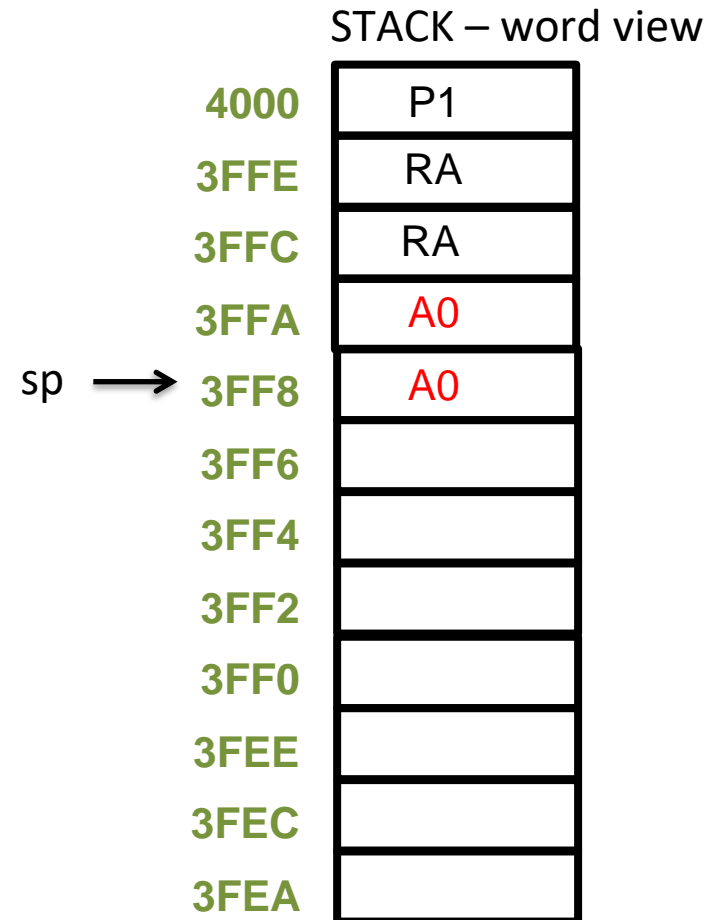

```
SUB    MOVEM.L    D1-D3/A0, -(SP)
      .
      .
      .
      MOVEM.L    (SP)+, D1-D3/A0
      RTS
```

Example

- Consider the following code

```
SUB    MOVEM.L    D1-D3/A0, -(SP)
      .
      .
      .
      MOVEM.L    (SP)+, D1-D3/A0
      RTS
```

Example

- Consider the following code

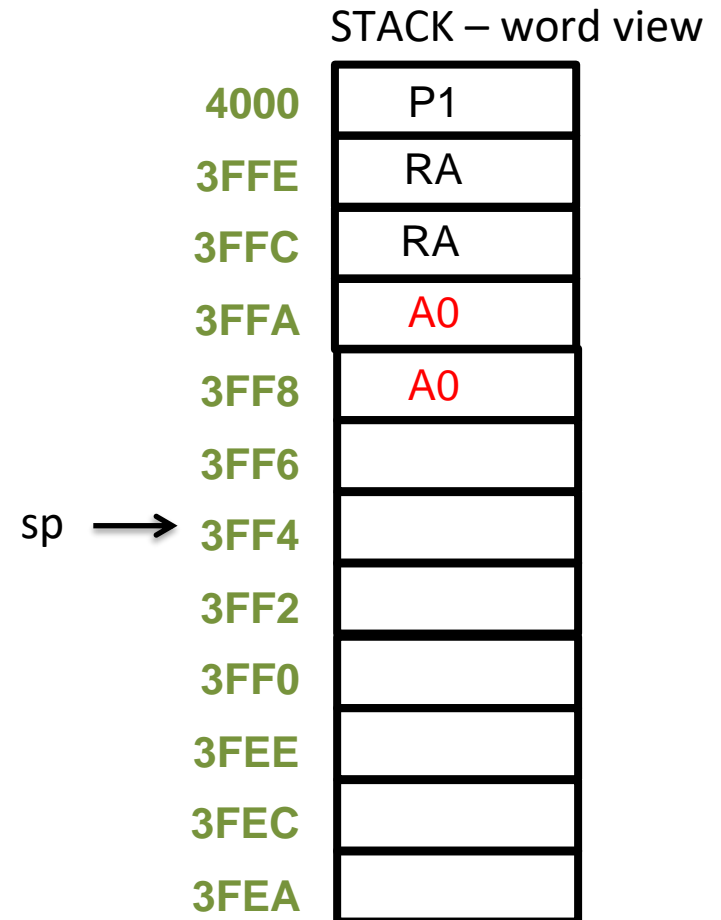

```
SUB    MOVEM.L    D1-D3/A0, -(SP)
      .
      .
      .
      MOVEM.L    (SP)+, D1-D3/A0
      RTS
```

Example

- Consider the following code

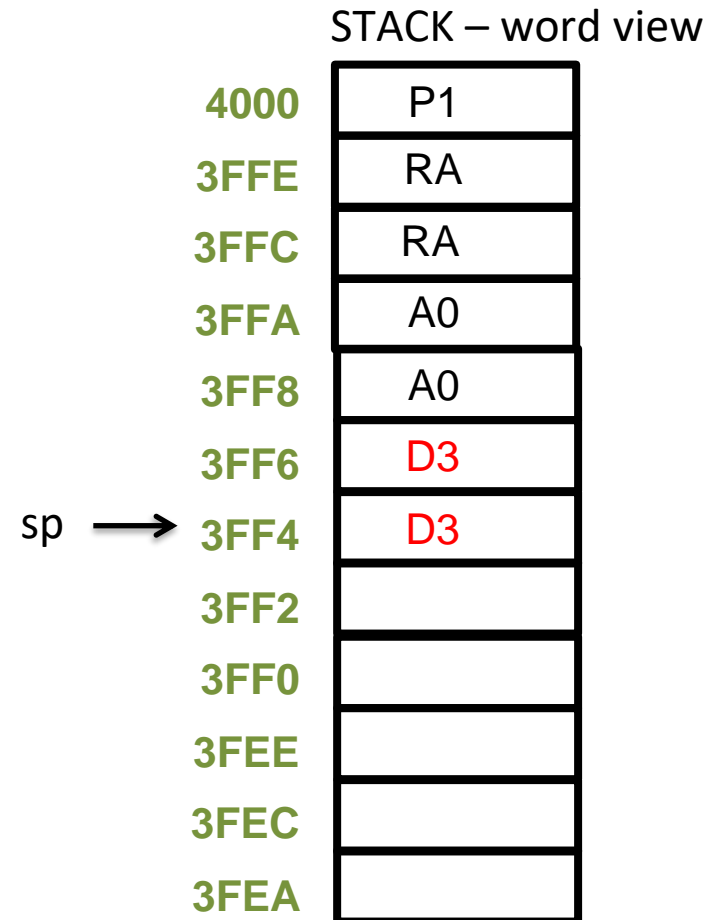

```
SUB    MOVEM.L    D1-D3/A0, -(SP)
      .
      .
      .
      MOVEM.L    (SP)+, D1-D3/A0
      RTS
```

Example

- Consider the following code

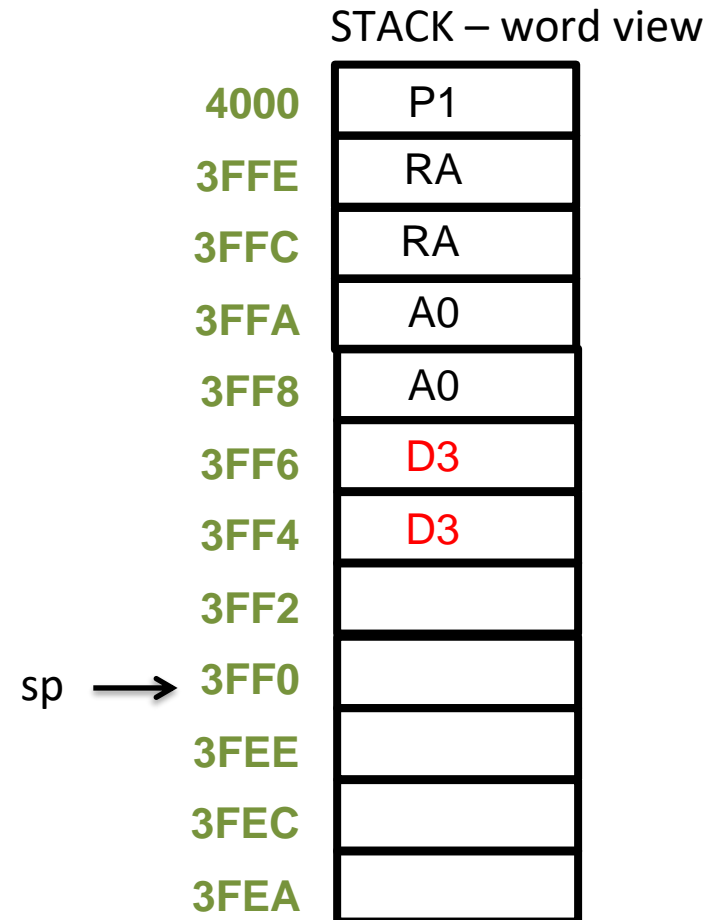

```
SUB    MOVEM.L    D1-D3/A0, -(SP)
      .
      .
      .
      MOVEM.L    (SP)+, D1-D3/A0
      RTS
```

Example

- Consider the following code

```
SUB    MOVEM.L    D1-D3/A0, -(SP)
      .
      .
      .
      MOVEM.L    (SP)+, D1-D3/A0
      RTS
```

Example

- Consider the following code

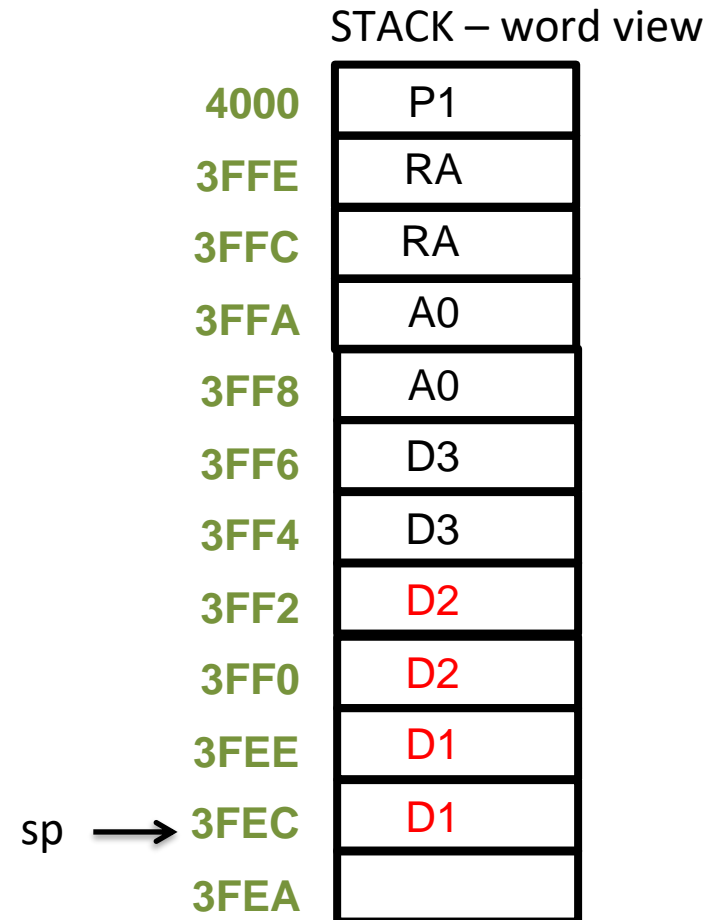

```
SUB    MOVEM.L    D1-D3/A0, -(SP)
      .
      .
      .
      MOVEM.L    (SP)+, D1-D3/A0
      RTS
```

Example

- Consider the following code

```
SUB    MOVEM.L    D1-D3/A0, -(SP)
      .
      .
      .
      MOVEM.L    (SP)+, D1-D3/A0
      RTS
```

Example

- Consider the following code

```
SUB      MOVEM.L   D1-D3/A0, -(SP)
        .
        .
        .
        MOVEM.L   (SP)+, D1-D3/A0
        RTS
```

D1, D2, D3, and A0 can be safely modified,
as their original contents will be restored
just prior to leaving the subroutine

STACK – word view

4000	P1
3FFE	RA
3FFC	RA
3FFA	A0
3FF8	A0
3FF6	D3
3FF4	D3
3FF2	D2
3FF0	D2
3FEE	D1
3FEC	D1
3FEA	

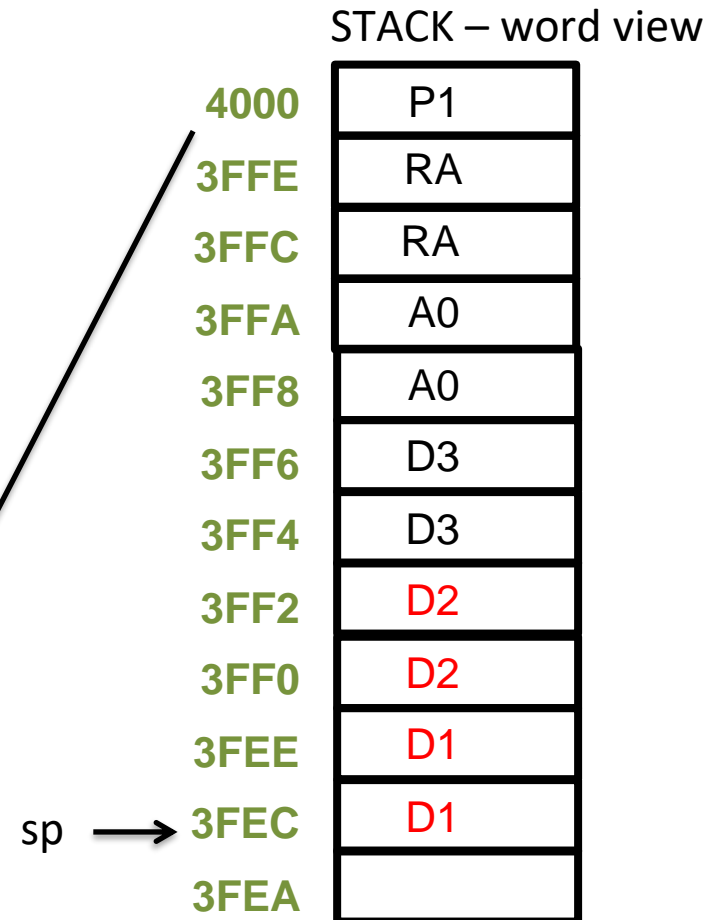

sp →

Example

- Consider the following code

```
SUB      MOVEM.L   D1-D3/A0, -(SP)
        .
        .
        .
        MOVEM.L   (SP)+, D1-D3/A0
        RTS
```

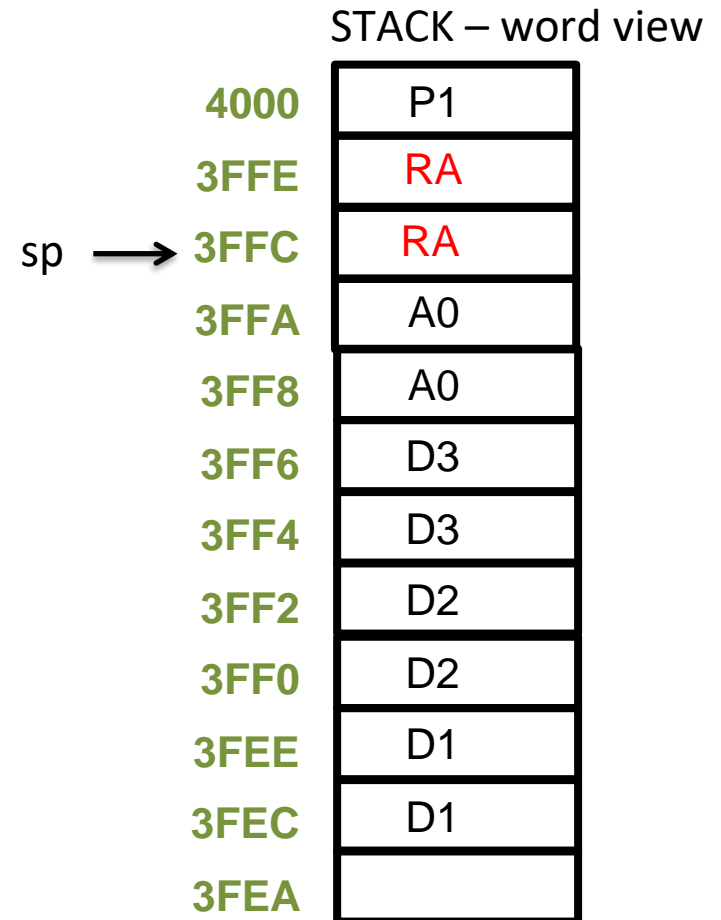

We saved 4 registers so P1 lives at
 $SP + (4 \times 4) + 4$

Example

- Consider the following code

```
SUB    MOVEM.L    D1-D3/A0, -(SP)
      .
      .
      .
      MOVEM.L    (SP)+, D1-D3/A0
      RTS
```

Summary

- Generality
 - Can be called with any number of arguments
 - Passing arguments on the stack does this
 - Pass-by-value
 - Pass-by-reference
- Transparency
 - Leave the registers as you found them, except if a register is being used to return a value to the caller
 - MOVEM accomplishes this
- Recursive
 - A subroutine should be able to call itself if necessary
 - This is done using stack frames, something that we will discuss next time
